We believe these units were used to combine two amplifiers to a common antenna. However, it would seem possible to split an antenna between transmitter and receiver with some additional filtering.

Each panel is supplied with test data. Examination of typical data showed insertion losses of 3.1 dB (spec 3.25 dB), 22 dB return loss at amplifier inputs, and >23 dB at antenna port (spec 18 dB). Isolation between input 1 & input 2 on the unit examined was > 30 dB (spec 18 dB). We ran a return loss / VSWR test on the dummy load, which shows VSWR readings as listed to the right:

Frequency (GHz)	VSWR (less than)
0-1.0	1.01
1.0-1.3	1.03
2.4-3.1	1.17
3.1-4.0	1.25
